G/030/62/002/009/004/004

**AUTHORS:** Boček, M., Kratochvíl, P., Lukáč, P. (Czechoslovakia)

**TITLE:** The effect of impurities on the critical resolved shear stress of zinc single crystals

**PERIODICAL:** Physica Status Solidi, v. 2, no. 9, 1962, 1221-1224

**TEXT:** Many measurements have been performed to explain in detail the effect of many parameters on the value of the critical resolved shear stress, the effect of impurities being of the greatest interest. The authors give a more detailed discussion of this subject than has previously appeared. It is assumed that during crystal growth a microsegregation takes place which is connected with the existence of a dislocation network. From this point of view the relation between the critical resolved shear stress of zinc single crystals and their purity is investigated. For the evaluation the measurements made by many authors on zinc single crystals were collected. Only those with solutes: that are soluble in the used range, i.e. they form solid solutions and that have known equilibrium distribution coefficients

Card 1/2

G/030/62/002/009/004/004

The effect of impurities on the critical...

are considered. The results: a) the square root dependence of  $\tau$ , the critical resolved shear stress, on  $\rho$ , the density of dislocations, and b) the good value of the constant 2.6 in  $\tau = 2.6 (\sqrt{\rho})^{0.94}$ , support the interpretation of the indirect effect of impurities on the critical resolved shear stress. Further calculations have shown that some other metals behave in the same manner. The authors thank Dr. E. Klier for many valuable comments on this work. One figure and one table are included.

TITLE: Gas chromatography in nuclear research

SOURCE: Jaderna energie, no. 3, 1966, 100

TOPIC TAGS: gas chromatography, nuclear research, nuclear reactor technology, radiation chemistry, nuclear fuel

ABSTRACT: NRI Report No 1351/65. The review includes 139 papers related to the use of gas chromatography in various fields of nuclear research. The first part deals with applications in reactor technique, in particular for studying nuclear reactions, in coolant research and in radiation chemistry. The second part deals with applications for the production and regeneration of nuclear fuel, the production of labeled compounds and in hot atom chemistry. Various methods of measurements of labeled compounds used in gas chromatography also are discussed. [Based on author's Eng. abst.] [JPRS: 36,845]

Title : Methods of recording conditioned reflex salivary secretions in dogs

Periodical : Fiziol.zhur.<sup>40</sup> 2, 224-226, Mar/Apr 1954

Abstract : Students of higher nervous activity have encountered difficulties in recording salivary secretion. Detailed description of an apparatus that records salivary secretion can be found in literature. This apparatus was developed by E. A. Ganike and improved by P. S. Kupalov. It became apparent to the authors of this article that additional changes were desirable. Improvements that they made enable the operator to note the exact amount of salivary secretion. The improved apparatus is a great contribution to the study of conditioned reflexes. Diagrams.

TITLE: Isolation and properties of a new pigmented antibiotic

SOURCE: Ref. zh. Biologiya, Abs. 22B253

REF SOURCE: Sb. Antibiotiki. Kiev, Zdorov'ya, 1965, 76-80

TOPIC TAGS: antibiotic, bacteriology, soil bacteriology

ABSTRACT: An actinomycete producing the new P-125 antibiotic has been isolated from the chernozem soils of Poltavsk Oblast. The producer culture forms a gray aerial mycelium and a violet substrate mycelium in synthetic media, and in organic medium No. 2 the culture develops a violet-brown substrate mycelium that colors the medium slightly brown; the spore carriers are straight. This strain is classified with the Violaceus series on the basis of culture and morphological indices; species identification has not been established. Liquid organic medium No. 2 is favorable for the formation of P-125. The culture liquid was saturated with sodium chloride and acidified to pH 3.0 to isolate P-125. Then a sediment was obtained containing mycelium and antibiotic

UDC: 615.779.931

46197.46

ACC WA AR6011882

precipitated from the culture liquid. The sediment was extracted three times with acetone and boiled down. P-125 was extracted with chloroform from the aqueous-acetone solution. The extract was concentrated and precipitated with petroleum ether or benzene. The preparation in appearance is a dark-red amorphous powder. P-125 has index properties; the UV absorption spectrum is 230 and 495 millimicrons in methanol and 315, 415 and 490 millimicrons in butanol. P-125 can be differentiated from violarin, litmocidin and antibiotic 770-M by its chromatographic properties and UV spectra. P-125 closely resembles rubidine. P-125 is classified as a new chemical compound of the rubromycin-griseorodine group. It is active in relation to gram positive bacteria and acid resistant bacteria. T. Maksimova. TITLE: Theoretical Investigation of the Throttle Cycle <sup>23</sup>

PERIODICAL: Tr. Kuybyshevsk. aviats. in-t, 1958, Nr 6, pp 115 - 142

ABSTRACT: The results of the heat calculation of the theoretical Otto-process are given for the four values of the initial pressure, changing because of the throttling, and for different values of the air abundance coefficient, the pressure of residual gases, the compression ratio, and the air temperature. An increase in the pump losses appears as the single cause for deterioration of the economy of this cycle.

TITLE: Investigating ternary complexes of tantalum and niobium by means of pyrogallol and addend III

PERIODICAL: Akademiya nauk UkrRSR. Dopovidi, no. 11, 1961,  
1504-1507

TEXT: Tantalum- and niobium complexes, formed in the presence of pyrogallol ( $H_2Pg$ ) and ethylenediamine tetra-acetic acid (denoted in the following by EDTA) were studied by spectrophotometric methods. The spectrophotometer  $CF-4(SF-4)$  was used. The absorption spectra showed that by adding EDTA to the solutions of pyrogallate complexes of tantalum and niobium, new complex compounds are formed, having characteristic (eigen) absorption bands with  $\lambda_{max} = 375 \mu$  (for tantalum) and  $480 \mu$  (for niobium). In order to determine the nature of the EDTA interaction, the isomolar series EDTA-tantalum (niobi-

D299/D304

Investigating ternary complexes ...

um) were studied in the presence of excess pyrogallol. Tantalum (niobium) pyrogallate also absorbs light. It was found that EDTA acts not only as a medium, but enters into the composition of pyrogallate complexes of tantalum and niobium, forming compounds in the ratio EDTA:Ta (Nb) = 1:1. The three-component systems form ternary compounds which have 2 different addends in the coordination sphere. The formation of new absorption bands (under the action of the EDTA) is apparently due to a change in the state of the central atom in

a reaction of type  $\text{NbO}_3^- + \text{H}_4\text{Y} \rightleftharpoons \text{NbOY}^- + 2\text{H}_2\text{O}$ . Graphs show the effect of pyrogallol concentration on the niobium (tantalum) complexes and other graphs show the effect of EDTA concentration on niobium (tantalum) pyrogallate. It was found that the dependence of  $1/g$

$\frac{[\text{Nb} \cdot \text{Y} \cdot \text{Pg} \cdot m]}{[\text{NbY}]}$  on  $1/g$   $[\text{H}_2\text{Pg}]$  is linear with  $\text{tg}\alpha = 1$ ; hence the number of moles of pyrogallol  $m = 1$ , which confirms the results of the isomolar series. Knowing the composition and the molar coefficients of absorption ( $E_{\text{Ta}}^{(375)} \approx E_{\text{Nb}}^{(480)} = 5700$ ) of the ternary complexes, it

60  
58AUTHOR: Lukachina, V. V.TITLE: Pyrocatechol complexes of tantalumSOURCE: Ukrainskiy khimicheskiy zhurnal, v. 29, no. 7, 1963, 689-698

TOPIC TAGS: pyrocatechol, tantalum, absorption spectra, HCl, niobium, oxalic acid, hydrochloric acid

ABSTRACT: The absorption spectra of complex systems of tantalum-pyrocatechol-oxalate were studied. It was shown that the oxalate ion enters into the composition of colored tantalum-pyrocatechol complexes which are formed at a pH of 2 to 3. The formation of the triple complexes  $[(TaO)C_2O_4Bz]^-$  and  $[(TaO)C_2O_4Bz_2]^{3-}$  was shown by isomolar series and equilibrium shift methods. The transformation of the first complex into the second takes place when  $[Bz] \approx 0.4$  mole/l. The equilibrium constants of the triple complexes were

Card

1/2

L 17701-63

ACCESSION NR: AP3003991

2

calculated at a pH of 2.5. It was shown that, with an increase in the solution's pH, the colored tantalum complex is transformed into a colorless pyrocatechol. Since niobium and tantalum behave differently during photometric determination, the interaction of their chlorides was studied with oxalic acid in 0.45 N HCl. It was found that Nb(V) and Ta(V) interact differently. The niobium ion combines with the oxalate ion, while the oxygen in the tantalum ion is replaced by the oxalate and forms a cation-type complex which interacts more readily with the pyrocatechol ions forming the triple complexes. Orig. art. has: 4 tables and 9 figures.

TITLE: Solubility and acid-base properties of the hydrates of tantalum and niobium oxides.

SOURCE: Zhurnal neorganicheskoy khimii, v. 8, no. 8, 1963, 1839-1845

TOPIC TAGS: tantalum, niobium, tantalum hydroxide, niobium hydroxide, nitric acid, tantalic acid, niobic acid

ABSTRACT: The solubility of freshly-precipitated tantalum and niobium hydroxides in nitric acid media was studied. It was established that the "isoelectric region" of the tantalic acid is in the pH interval from 9 to 2. This region is in a pH interval of 7-0 for niobic acid. The above shows that the metallic properties of tantalum are more pronounced than those of niobium. The effect of the degree of concentration of H<sup>+</sup> and OH<sup>-</sup> on the solubility of tantalic and niobic acids has been calculated. It

Card 1/2

L 17426-63

ACCESSION NR: AP3004345

2

was established that, in acidic as well as in basic media, the monomeric ions of tantalum and niobium are formed in the initial stage of solubility. The constants of basic and acidic dissociation of tantalum and niobium hydroxides were calculated when the solubility was doubled. The instability constants of the hydroxy complexes of tantalum and niobium were calculated from the results of the basic dissociation constants and with application of electrostatic characteristics. Effect of the rate and duration of centrifuging for completeness of the separation of the precipitate has also been studied. Orig. art. has: 3 tables, 5 graphs and 8 equations.
